

## CHASSIS EAR ELECTRONIC SQUEAK & RATTLE FINDER

Chassis ears are an electronic device that transmits vibration from various locations of a vehicle's engine, axles, chassis, etc., via microphone clamps that are connected to the main unit, where they are converted to sound.

The ultra-sensitive professional headphones block out any background noise, allowing the user to focus on what the microphones pick up. Sensors easily clamp onto problem areas of cars and trucks, making the system easy to use and can be set up in a matter of minutes.

## TEE-KAY HEAD CHECK COMBUSTION LEAK DETECTOR

The Tee-Kay head check combustion leak detector is designed to check combustion gases in the cooling system. It works by analysing the air within the 'air cushion' above the radiator coolant level.

When CO2 gas is detected in petrol engines, the blue fluid will turn yellow, or green in diesel engines. Spare parts available.
